

SEMESTER AT SEA COURSE SYLLABUS

Voyage: Spring 2013

Discipline: Biology

BIOL 3559: Conservation Biology

Division: Upper

Faculty Name: Frank von Hippel

Pre-requisites: Introductory Biology or Environmental Science

COURSE DESCRIPTION: This upper-division course reviews the drivers of global environmental change (human population growth and consumption of resources), resulting environmental degradation, and tools to slow down or reverse environmental damage. The course begins with analyses of levels of biodiversity and species richness, and then covers concepts in demography, such as source and sink dynamics and population viability analysis. These concepts are then employed to understand major environmental problems, including habitat conversion and modification, climate change, eutrophication, acid rain, stratospheric ozone depletion, endocrine disruption due to contaminants, trade in threatened species, and biological invasions. Connections are explored between biodiversity and human health in a changing global environment. Interactions and synergisms between environmental problems are then illustrated via analysis of the global declines of amphibians, reptiles and primates. The final third of the course explores the conservation biology toolbox, including conservation genetics, island biogeography and the design of nature reserves, and environmental policy. Special attention is paid to conservation problems along the route of the Semester at Sea voyage.

COURSE OBJECTIVES:

- To teach students how human population growth and consumption of resources drive environmental problems. The student will understand the major environmental problems the Earth now faces, such as climate change, eutrophication, acid rain, stratospheric ozone depletion, contaminants and endocrine disruption, habitat modification and conversion, biological invasions, and global declines of amphibians, reptiles, and primates. The student will understand how many of these problems interact in a synergistic fashion, and therefore the student will improve complex thinking skills.
- To teach students tools for assessing and addressing environmental degradation. Students learn these tools both in class and on field exercises. The student will understand major tools for solving environmental problems, such as legislative tools (e.g., CITES, ESA), tools in conservation genetics, island biogeography and its application to reserve design, and economic tools (e.g., debt for nature swaps, analysis of lost opportunity costs).
- To teach students to analyze conservation problems in a multidisciplinary manner with consideration of economics, law and policy alongside scientific fields such as conservation genetics, environmental chemistry and population demography.

REQUIRED TEXTBOOKS

AUTHOR: Martha J. Groom, Gary K. Meffe, C. Ronald Carroll

TITLE: Principles of Conservation Biology

PUBLISHER: Sinauer Associates, Inc.

ISBN #: ISBN-10: 0878935975, ISBN-13: 978-0878935970

DATE/EDITION: 2005, third edition

TOPICAL OUTLINE OF COURSE

Class #	Topic	Reading
1	Diversity of life 1: species richness, taxonomy & conservation	Chapter 1
2	Diversity of life 2: levels of biodiversity and species richness	Chapter 2
3	Environmental problems: drivers & consequences	Chapter 3
4	Conservation values & ethics	Chapter 4
5	Ecological economics & nature conservation	Chapter 5
6	Habitat degradation & loss	Chapter 6
7	Habitat fragmentation	Chapter 7
8	Overexploitation	Chapter 8
9	Biological invasions	Chapter 9
10	Climate change 1	Chapter 10
11	Climate change 2	“
12	Midterm Exam	
13	Conservation genetics 1	Chapter 11
14	Conservation genetics 2	“
15	Species & landscape approaches to conservation	Chapter 12
16	Ecosystem approaches to conservation	Chapter 13
17	Island biogeography & protected areas 1	Chapter 14
18	Island biogeography & protected areas 2	“
19	Restoration ecology	Chapter 15
20	Sustainable development	Chapter 16
21	Conservation science & policy	Chapter 17
22	Complex conservation challenges	Chapter 18
23	Biodiversity revisited	

24	Final Exam	
----	-------------------	--

FIELD WORK

***FIELD LAB** (At least 20 percent of the contact hours for each course, to be led by the instructor.)*

Potential field labs include:

Urban ecology of Shanghai. We will visit the “forest corridors” of Shanghai, where the government has initiated an urban forest restoration program. We will learn about changing forest landscapes in urban settings, including conservation implications of forest fragmentation, edge effects, reforestation and tree species diversity. We will investigate the effects of Shanghai’s program on urban environmental quality, including air and water quality. We will study effects on bird species diversity, and learn about conservation partnerships between government and non-governmental organizations. Each student will create detailed journal entries of their observations, questions and interpretations, with special attention paid to effective scientific journal notes and illustrations.

Mangrove forest and riverine restoration in Ho Chi Minh City. We will visit the Vam Sat Marshlands, a formerly degraded ecosystem due to exposure to toxic chemicals from war. The marshlands have been the focus of intensive restoration, and are home to saltwater crocodiles, river otters, pythons, monkeys, wildcats and flying foxes. We will learn about how the ecosystem was degraded, what was done to restore ecological functions and wildlife populations, and what more could be done to improve the habitat. We will learn about the natural ecology of mangrove forests and how that ecology is disrupted by contaminants. We will learn about the ecology and conservation of resident wildlife. Each student will create detailed journal entries of their observations, questions and interpretations, with special attention paid to effective scientific journal notes and illustrations.

Mangrove forest and orangutan conservation in Malaysia. We will visit a small island with a family of orangutans to learn about orangutan ecology and conservation. We will then visit the Taiping Lake Gardens and the Matang Mangrove Forest Reserve to learn about mangrove forest ecology, conservation and management. We will also see how local people use mangrove wood to produce charcoal. Each student will create detailed journal entries of their observations, questions and interpretations, with special attention paid to effective scientific journal notes and illustrations.

FIELD ASSIGNMENTS

In addition to the field lab assignment described above, each student will complete a journal entry for 6 of the 13 ports that we visit (the student chooses the ports to include). Each journal entry will address a question from the course that has relevance to the chosen port. The journal entry will be a descriptive analysis of the question, and may include species lists, list of rank-ordered threats, analysis of conservation actions, illustrations, interviews, habitat inventories, and the like. Journal

entries will be due on the second day at sea following the port visit. Journal entries will be evaluated based on clarity, content, quality of writing, depth of analysis, and effectiveness of illustration. Feedback will be given for each entry in order for the student to improve future entries.

METHODS OF EVALUATION / GRADING RUBRIC

Field lab assignment = 20%

Journal entry for each port = 5% x 6 ports = 30%

Midterm exam = 25%

Final exam = 25%

ELECTRONIC COURSE MATERIALS

n/a

ADDITIONAL RESOURCES

Each student must also have a rite-in-the-rain bound notebook for their journal entries. I prefer the Rite in the Rain Fabrikoid Cover Bound Book, "blank bound book", available from Ben Meadows (benmeadows.com) as item number 197290 for \$18.00.

Each student must have a good supply of pencils.

HONOR CODE

Semester at Sea students enroll in an academic program administered by the University of Virginia, and thus bind themselves to the University's honor code. The code prohibits all acts of

lying, cheating, and stealing. Please consult the Voyager's Handbook for further explanation of what constitutes an honor offense.

Each written assignment for this course must be pledged by the student as follows: "On my honor as a student, I pledge that I have neither given nor received aid on this assignment." The pledge must be signed, or, in the case of an electronic file, signed "[signed]."

Principles of Conservation Biology, Third Edition, features a wholly revised organization, emphasizing analyses of different categories of threat and approaches to conservation. Coverage has been expanded to incorporate both terrestrial and marine conservation issues, and efforts in the U.S. and across the globe. The book's eighteen chapters introduce the major themes and concepts of this diverse and dynamic field. The biological and social underpinnings of conservation problems and potential solutions are interwoven throughout the text, which is divided into three sections: foundations of Conservation Biology, Pages 1180–1190 Volume 18, No. 5, October 2004. Education Committee of the SCB. The principles we present here emerge from the large body of research in ecology and genetics, from the practice of conservation over the last century, and from a variety of emerging interdisciplinary perspectives in the social sciences. Thorough overviews of the theoretical and empirical bases for these guidelines have been given by Meffe and Carroll (1997), Massa and Ingegnoli (1999), Garcia (2002), Primack (2002), and Hunter (2002). Here we aim to describe the body of knowledge that we vie
