From the Back Cover. *The Economics of Time and Ignorance* is one of the seminal works in modern Austrian economics. Its treatment of real time and of uncertainty helped set the agenda for the remarkable revival of work in the Austrian tradition which has led to an ever wider interest in the once heretical ideas of Austrian economics. It is here reprinted with a substantial new introductory essay, outlining the major developments in the area since its original publication a decade ago.Â This book does much to advance the marginalist-subjectivist paradigm in economics. Most economists treat time trivially in their analysis. Some, like Gary Becker, correctly recognize the need to examine how people allocate the only non-renewable resource- time. A history of economic thought perspective on *The Economics of Time and Ignorance* reveals that the book rehabilitates some major themes in the Austrian tradition that were all but lost subsequent to the formalist revolution in economics that took place in the middle of the twentieth-century. The book also anticipates some important ideas that were extended and applied in Austrian economics after it was first published.

In health economics, economists and health professionals have adopted Health Adjusted Life Years indicators (QALY or DALY) as a criterion for allocating resources in hospitals. This requires different value judgments regarding the meaning and comparability of years to be saved and other trade-offs. In transportation economics, time is a tough issue when it comes to calculating social discount rates to determine the price of saved transportation time (distinguishing between leisure time and labor time, the kind of transportation used, and so forth). These are just two examples when time is given value.
